

Abstract

This bachelor dissertation with the name „Impact of having a child with autism on health and quality of life” is divided into the theoretical and the empirical part. The theoretical part contains 3 mains chapters which give a brief overview of basic knowlege in autism and quality of life. This part of the bachelor dissertation is based on already published sources related to this subject. The empirical part describes the methodology and organization of the survey which was realized with structured questionnaire SQUALA and other supplementary questions. The survey itself provided information on assessing the importance and assessment of the satisfaction of individual areas of quality of life of parents caring for an autistic child. At the end of the thesis, there are summarized the most important findings resulting from the survey and evaluated objectives of the dissertation.
